SAI: ICP and Buyer Personas

Version 2.0 | 21 August 2026 | Supersedes the SAI section of the consolidated ICP document

---

1. What we are selling

The modern agentic stack, the harness, workflow generation, memory, orchestration, runtime, compliance, security, data lake, fine-tuning and cloud, normally takes a ten to fifteen person team about six months to assemble and keep running. SAI does the build in roughly two hours from a prompt and then manages it in production, with governance, observability and a marketplace attached. The buyer is anyone who needs that team's output and cannot or should not assemble that team.

2. Geography

India first, US second. India gives volume, ecosystem depth and proof through the LaunchLab and institution motion. The US gives price.

3. The ICP definition

A qualified SAI account has these properties:

1. It needs to build and ship AI products, agents or workflows, either for itself or for clients.
2. It does not have, and does not want to fund, the ten to fifteen person platform team the stack demands.
3. It can decide fast: a founder, a CTO, a practice head or an individual developer, without a formal procurement cycle.
4. It is in India or the US.

Large enterprises fail the third test today, not the first two. They are partner-led.

4. Target segments

Segment	What they look like	The pain	What SAI gives them
GSIs and SIs	Global and regional system integrators selling AI delivery to enterprise clients	Delivery capacity is headcount; every engagement rebuilds the same plumbing; margins depend on utilisation	Each delivery pod ships what three used to; the plumbing is already built and governed; and a resale route into their own enterprise accounts
Startup founders	AI-native and AI-adopting startups	Cannot hire the platform team and cannot spend six months before the product exists	From prompt to running system in hours; the stack question disappears and the roadmap starts at the product
Independent developers	Freelancers, indie hackers, consultants	Want leverage, and increasingly want income from what they build	Developer mode with CLI and SDK; build, publish and monetise on the marketplace, paying 15 percent commission only on what they earn
Developer organisations	Engineering teams standardising how agents get built	Fifteen tools, no governance, every team reinventing the base layer	One stack with control tower, observability and compliance built in rather than bolted on
Mid-market companies building their own AI products	50 to 500 person companies that tried an internal build and stalled	A year burned on infrastructure, product still not shipped, team frustrated	They stop needing the platform team, because they have the platform; the internal effort restarts at the application layer

5. The ABM persona map

SAI's ladder is the shortest of the three products because the user is technical and the proof is a working system. The daily user is a developer or engineer. The influencer is the CTO, the head of engineering or the practice head, tech-savvy by definition and measured on shipping. The decision maker scales with size: the developer themselves, the founder, the CTO, the CIO, or the SI managing partner.

Segment	**User (daily)**	**Influencer**	**Decision maker**	**Blocker to watch**
GSI or SI	Delivery engineers, solution architects	Practice head, CTO of the practice	Managing partner or practice P&L owner	Existing alliance commitments to hyperscaler stacks; "we build our own IP" instinct
Startup	The founding engineers	CTO or technical co-founder	Founder or CEO	A CTO who wants to build the stack as a badge of craft
Independent developer	The developer	The developer	The developer	Nobody; the only gate is time to first working agent
Developer organisation	Engineers across teams	Head of Engineering, platform lead	CTO or CIO	Security and platform governance review; the internal platform team whose roadmap this replaces
Mid-market AI builder	The AI or data team	Head of Engineering, CTO	CEO or CIO	Sunk-cost defence of the stalled internal build

The recurring blocker across every technical segment is the same person: the engineer or team whose identity is invested in building the stack themselves. The champion version of that same person is the one who would rather ship product than plumbing. Which one shows up is determined by whether SAI arrives as a threat to their work or as the thing that gets their actual product live.

6. Entry point by size

Individual developers. Self-serve. LaunchLab, the community, the marketplace and the LMS are the funnel; no sales conversation exists or should.

Startups. Founder-led. Enter at the founder or CTO, and the proof is a built system in the first session, not a deck.

Mid-market and developer organisations. Enter at the head of engineering or CTO, win them with a governed pilot, and let them take it to the CEO or CIO with the budget case.

GSIs and SIs. Enter at the practice head with a margin-per-engagement story, close with the managing partner. This is a one-to-many account twice over: many delivery pods inside, and many enterprise clients beyond.

7. Anti-targets and partner routes

Large enterprises are the explicit anti-target for direct GTM, despite being an excellent product fit, because their procurement and security cycles need sales muscle we do not have yet. The GSIs and SIs in our own ICP are the route to them: the partner owns the relationship and the closing motion, SAI rides the engagement. We do not lose the enterprise market, we reach it through the people who already know how to close it.

8. Qualification checklist

1. Do they need to build and ship AI products, agents or workflows?
2. Are they trying to avoid, or escape, the ten to fifteen person platform team?
3. Can a founder, CTO, practice head or the developer themselves decide, without procurement?
4. India or US?
5. Is it a large enterprise? If yes, find the SI who owns the account and go through them.
6. Is it an SI, GSI or developer organisation? If yes, treat as one-to-many and prioritise.
