ADYA · SAI · THE SUPERAGENT AI

Build with 15 tools.
Or just ask SAI.

One agent that orchestrates hundreds of AI workflows, agents, tools, and LLMs in the background.
Governed, deterministic, deployed on your cloud.

For CTOs, builders, and system integrators

THE PROBLEM

Two sides of the same gap

BUSINESSES CAN'T OPERATIONALIZE AI

- They see the potential but can't map it to real workflows
- Pilots stall before production; ROI stays theoretical
- Security, governance, and data-residency reviews block go-live

BUILDERS DROWN IN FRAGMENTED TOOLING

- The market maps count 100+ vendors across 6 to 7 stack layers
- Stitching workflow engines, agent frameworks, memory, and deploys separately
- Endless glue code across 100+ LLMs and integrations, and non-deterministic agents nobody trusts in production

There is no moat in building agents. The moat is the factory that builds, governs, and deploys them at scale.

BEFORE · HOW SYSTEMS GET BUILT TODAY

Two ways to build. Both expensive.

PATH ONE · THE 10X ENGINEER · 0.01%

Spec	ChatGPT, Claude, manual
Coding	Replit · Bolt · Lovable · Codex · Antigravity
Workflows	n8n · Make · Flowise · Relay
Orchestration	Claude Code · LangGraph · AutoGen
Data	Airbyte · Mem0 · Honcho
Models	Together AI · Unsloth · Hugging Face
Cloud	AWS · GCP · Azure · IaC · GPUaaS
Governance	Claimify · Microsoft · Google
Observability	Langfuse · Arize · LangSmith

PATH TWO · THE TEAM · EVERYONE ELSE

Product Manager	PRD
Architect	Solutions architecture
Designer	Screens, UI and UX
Compliance	Business rules (BRMS)
Developers	Frontend, backend, databases
DBMS Engineering	Data lake
QA Testers	Testing, improvements
DevOps	Cloud management

10 to 15 people · 6 months

Fifteen-plus tools or fifteen people. Either way, insight and control live outside your system.

AFTER · WITH SAI

SAI replaces the layers that build and think. Your stack stays.

SAI REPLACES

Spec & architecture · PRD, solutions architecture, diagrams

Coding · frontend, backend, databases, tested before ship

Workflows · AIA turns processes into automations

Orchestration · the harness coordinates every agent

Data & memory · AI ELT, data lake orchestration, ESM

Models · Model Studio trains, deploys, scales

Infra, governance, observability · Cloud Studio, AGP, Control Tower

THE RAIL THAT STAYS

Your cloud

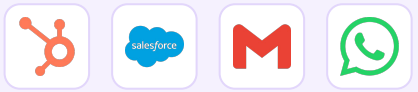

Your models

Your repos & CI

Your systems

Zero rip-and-replace. Your data never leaves your tenant.

AFTER · WITH SAI

The same ten layers, run by SAI (L1 to L5)

L1 **Spec & Architecture**	**SAI runs it.** PRD Agent, Architecture Agent, and Diagram Agent produce the PRD, solutions architecture, UX flows, DFDs and ERDs from your prompt.	RAIL None needed
L2 **Coding**	**SAI runs it.** SAI's coding agent builds frontend, backend and databases under deterministic protocols: ~38 sub-agents, including adversarial agents that attack the code and testing agents that write and run tests before anything ships.	RAIL 
L3 **Workflow Generation**	**SAI runs it.** AIA turns business processes into runnable workflows, and improves them with a self-improvement pipeline.	RAIL None needed
L4 **Orchestration & Runtime**	**SAI runs it.** MAN, the Multi-Agent Network: agents coordinate with no central orchestrator. Decentralized, event-driven, parallel.	RAIL None needed
L5 **Integrations & Tools**	**SAI runs it.** AIA connects through the MCP gateway and registry: 1,000+ MCP integrations, 300+ LLMs, and model platforms like AWS Bedrock, Vertex AI, and Ollama.	RAIL Your existing systems

One prompt. One factory. One loop.

AFTER · WITH SAI

The same ten layers, run by SAI (L6 to L10)

L6 **Data & Memory**	**SAI runs it.** AI ELT maps and unifies your data and orchestrates the data lake. ESM gives agents memory at user, session, project and enterprise level, with compaction and continuous learning.	RAIL  Your source systems
L7 **Models & Fine-tuning**	**SAI runs it.** Model Studio finds or generates training data, trains a model from scratch, deploys it, and manages scaling and performance.	RAIL  BYO models and keys
L8 **Cloud & Infrastructure**	**SAI runs it.** Cloud Studio: GPU acceleration and GPU-as-a-service, service mesh, CI/CD, sovereign deployment in your own tenant.	RAIL  Your cloud
L9 **Governance, Compliance & Security**	**SAI runs it.** AGP converts your SOPs and rules into deterministic constraints agents must follow by design. Compliance lives in the Control Tower.	RAIL **None needed**
L10 **Observability & Improvement**	**SAI runs it.** The Control Tower traces, audits and manages performance. ESM plus AIA self-improvement close the learning loop in production.	RAIL **None needed**

One prompt. One factory. One loop.

WHAT SAI IS MADE OF

Three core IPs, six engines, one SuperAgent

CORE IP

MAN · Multi-Agent Network

Agents coordinate with no central orchestrator: decentralized, event-driven, parallel, stable at 5,000+ agent clusters.

CORE IP

ESM · Event-Sourced Memory

Memory at user, session, project and enterprise level. Every action tracked and learnable, with compaction.

CORE IP

AGP · Adaptive Governance Protocols

Your SOPs and SLAs become deterministic constraints agents follow by design, not by prompt.

ENGINE

The Harness

PRD, Architecture and Diagram agents plus the coding agent: ~38 sub-agents with adversarial and testing gates.

ENGINE

AIA · Workflow Generator

Processes become runnable workflows. Connects via the MCP gateway and registry: 1,000+ MCPs, 300+ LLMs, AWS Bedrock, Vertex AI, Ollama.

ENGINE

AI ELT

Maps and unifies data across CRMs, ERPs, finance systems and lakes into one fabric. Orchestrates the data lake.

ENGINE

Model Studio

Finds or generates training data, trains a model from scratch, deploys it, manages scaling and performance.

ENGINE

Control Tower

Observability, auditability, compliance and performance management for everything the agents do.

ENGINE

Cloud Studio

GPU acceleration and GPU-as-a-service, service mesh, CI/CD, sovereign deployment in your own tenant.

Hours, not months: what a 10-15 person team ships in six months, SAI stands up in about 2 hours, then manages in production.

AROUND SAI

Learn, ship, sell. With a community already building.

Marketplace

Showcase and monetize what you build. Adya takes a 15% commission only when a member monetizes.

Learning Management System

Courses and co-branded certifications on the Adya LMS, recognised across the community.

Community layer

Groups, bi-monthly sessions, and office hours for builders, anchored by the Adya LaunchLab program.

Developer mode

Vanij developer mode with a CLI and SDK, for builders who want code-level control alongside the prompt.

Already in use: 96,000+ developers engaged · 1,005 fellowship teams building · 100+ institutions live · backed by Startup India and MeitY (Adya LaunchLab)

PROOF · BENCHMARKED, NOT PROMISED

The agents underneath are ranked in public

#8

Terminal-Bench 2.0

agentic terminal tasks

#6

SWE-Bench

at launch, real software engineering

World #3

BIRD-Bench R-VES

text-to-SQL over real databases, listed as RAS / Adya AI

MAN + ESM, the coordination layer, published at adya.ai/research/man-esm:

10/10 vs 0/10

T-bench task resolution, MAN+ESM vs LangGraph (same model, same prompts)

95 ms vs 8.2 s

p50 coordination latency at 100 agents, vs LangGraph (preliminary)

5,000+ agents

max stable cluster, vs ~50 on LangGraph (preliminary)

Benchmark ranks as at launch on public leaderboards. Infra figures preliminary; audited values ship with the paper.

What changes for you

10-15 people → 1 prompt

The build team collapses into a conversation. Your people supervise, guide, and decide.

6 months → ~2 hours

First production build in hours, with spec, tests, deployment, and governance included.

15 tools → 1 platform

Fifteen subscriptions, glue code, and vendor reviews become one governed system.

Build once → improves itself

ESM and AIA keep learning in production. The system you ship is the worst version you will ever run.

Capacity you configure, not headcount you recruit.

WHY ENTERPRISES TRUST IT

Deterministic where it matters. Sovereign by design.

AGP: rules agents cannot break

Your SOPs and SLAs become deterministic constraints agents follow by design, not by prompt.

Tested before it ships

Adversarial agents attack the code; testing agents write and run tests. Nothing ships untested.

Everything observable

The Control Tower traces, audits and manages performance for every agent action.

Your cloud, your data

Deployed in your own tenant. BYO models and keys. Zero rip-and-replace, no data leaves.

Humans supervise, guide, and decide. Agents do 80-90% of the work.

WHO SAI SERVES

Three personas, one platform

System Integrators

Industrialize AI delivery across dozens of client engagements. Reusable vertical SuperAgents, predictable PoC-to-production, healthy margins.

Developers & platform teams

Ship agentic apps fast without stitching twenty disconnected tools. One prompt to spec, build, deploy, and govern.

Startup CTOs

Ship an AI-native product with a lean team and a tight runway, with enterprise-grade trust from day one.

Different jobs, same factory.

SAI

It specs. It builds. It deploys. It governs. It improves itself.

One prompt. Hours to production. Managed for life.
